

The Average

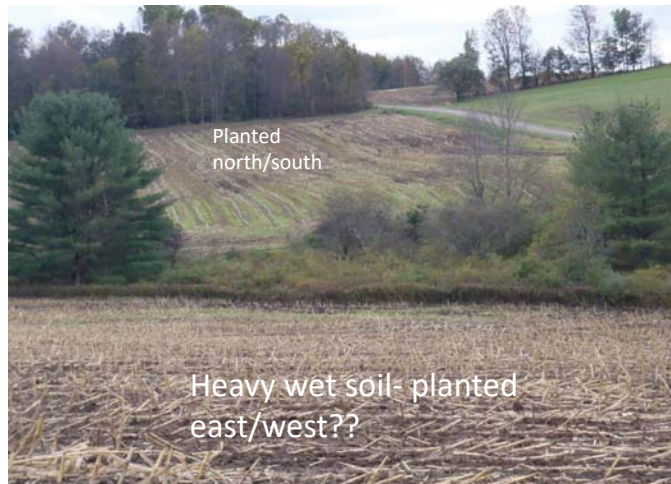

The Ugly

-lessons learned, things to watch for, issues encountered

Manure application post harvest

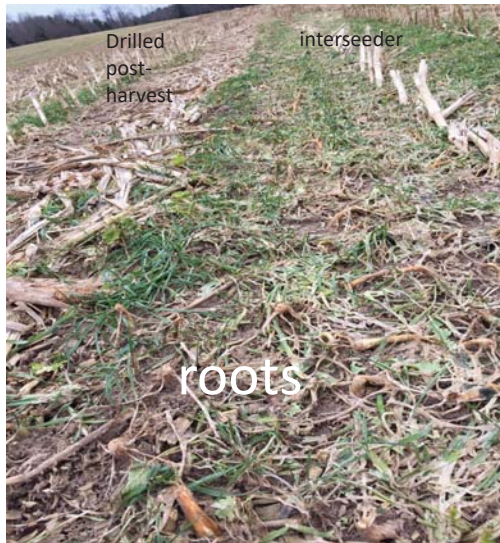

Mid-winter pics

Other uses for Highboy

New seedings

Apply Cover Crops at knee
high corn

Other thoughts or uses?

Topdressing nitrogen at later growth stages of corn

Frost-seeding a cover crop in late February or March

Post harvest corn silage- broadcast seed faster than any other way of seeding a crop, then have producer apply a coating of liquid manure

- We can cover an acre (or more) per minute. Application of manure after that will help seed with moisture retention and seed to soil contact. There is good research out there on having really good luck with this system.
